Strategic Communication Apr 28 2020 Strategic communication comprises different forms of goal-oriented communication inside and between organizations, their stakeholders and the society. Strategic communication is an emerging practice and research field integrating established disciplines such as public relations, organizational communication and marketing communication into a holistic framework. The field is based on an awareness of the fundamental importance of communication for the existence and performance of all organizations. This textbook offers a broad insight into the field of strategic communication. The main aim of the book is to give a general overview of theories, concepts and methods in strategic communication. The book also aims to develop an understanding of different perspectives and the consequences each one has for practice. After reading the book the student or reader will be able to define and reflect upon strategic communication as an academic field and professional practice, describe relevant theories and apply these to communication problems. The authors apply a reflective and practice-oriented approach meaning earlier research or theories are not only described, but also discussed from different critical perspectives. A practice-oriented approach means, in this book, that the authors strongly emphasize the role of contexts and situations--where strategic communication actually happens. This book will help business and communications students to not only define and understand a variety of strategic communications theories, but to use those theories to generate communication strategy and solutions.

Communication Over Fading Dispersive Channels Sep 02 2020 The transmission of digital information over a fading dispersive channel is considered, subject to a bandwidth constraint on the input signals. A specific signaling scheme is

proposed, in which information is transmitted with signals formed by coding over a set of smaller basic signals, all of which excite approximately independent and orthogonal outputs. The problem is then modeled as one of block coding over successive independent uses of a diversity channel. Upper and lower bounds to the minimum error probability attainable by such a scheme are derived. These bounds are exponentially decreasing in terms of the time available for information transmission, and agree asymptotically for a range of rates. These bounds are used to interpret the significance of different signal and channel parameters, and the interplay between them. Some conclusions are drawn concerning the nature of good input signals, the major one being that any basic signal should be transmitted at one of a small number of discrete voltage levels. Several numerical examples are included, to illustrate how these results may be applied in the estimation of performance levels for practical channels. (Author).
