Categorization of Atmospheric Turbulence in Terms of Aircraft Response for Use in Turbulence Reports and Forecasts

Nov 16 2021 This report describes a method of calculating the gust sensitivity of conventional aircraft and presents gust sensitivity values for a total of 69 military and civilian aircraft. Gust sensitivity is presented in terms of the vertical load factor response of aircraft per foot per second discrete gust. The information is intended to permit organizations engaged in the forecasting of atmospheric turbulence to properly take into consideration the capability of particular aircraft to operate safely in various turbulence levels. The basis for calculating the gust sensitivity is the so called 'gust loads formula' which is a single degree of freedom mathematical model of the aircraft excited by a one-minus-cosine shaped wave form of 25 chord wave length. An empirical equation is used

to calculate the aircraft normal force coefficient over the subsonic, transonic, and supersonic airspeed range.

Institut under the auspices of the International Astronomical Union. Volume 59/60 - the fifth Cumulative Index of Astronomy and Astrophysics Abstracts - comprises author, subject, and object indexes to volumes 49 - 58. Thus, the astronomical and astrophysical literature of the five-year period 1989 - 1993 is covered by this volume.

Astronomy and Astrophysics Abstracts Nov 23 2019

From the reviews: Astronomy and Astrophysics Abstracts has

appeared in semi-annual

volumes since 1969 and it has already become one of the

fundamental publications in the fields of astronomy,

astrophysics and neighbouring sciences. It is the most

important English-language abstracting journal in the

mentioned branches. ... The abstracts are classified under

more than hundred subject categories, thus permitting a

quick survey of the whole

extended material. The AAA is

a valuable and important

publication for all students and scientists working in the fields

of astronomy and related

sciences. As such it represents a necessary ingredient of any

astronomical library all over the world." Space Science

whole field plus related subjects into 108 categories, each work is numbered and most are accompanied by brief abstracts. Fairly comprehensive cross-referencing links relevant papers to more than one category, and exhaustive author and subject indices are to be found at the back, making the catalogues easy to use. The series appears to be so complete in its coverage and always less than a year out of date that I shall certainly have to make a little more space on those shelves for future volumes." Author and Subject Indexes to Volumes 25-34, Literature 1979-1983 Oct 03 2020

Astronomy and Astrophysics Abstracts aims to present a comprehensive documentation of the literature concerning all aspects of astronomy, astrophysics, and their border fields. It is devoted to the recording, summarizing, and indexing of relevant

publications throughout the world. Astronomy and Astrophysics Abstracts is prepared by a special department of the Astronomisches Rechen-Institut under the auspices of the International Astronomical Union. Volume 35/36 - the third Cumulative Index of Astronomy and Astrophysics Abstracts - comprises Author and Subject Indexes to Volumes 25-34. Thus, the astronomical and astrophysical literature of the five-year period 1979-1983 is covered by this volume. It is a pleasure to express our gratitude to Ms. Dietlinde Krahn, Ms. Anna Schmadel, Mr. Gernot Burkhardt, Mr. Vladimir R. Matas, Mr. Martin Schlotelburg, Mr. Ulrich Uberall and Mr. Gert Zech for their kind support during the detailed preparation steps of the indexes. Heidelberg, May 1984 Inge Heinrich Lutz D. Schmadel Introduction This third Cumulative Index of Astronomy and Astrophysics Abstracts The Author Index contains all authors, co-authors and editors of abstracts aims to present a concise collection of author

names and publications abstracted in Volumes 25-34 and covered by the key words - the most important bibliographical items for literature separate indexes. Efforts have been made to give the names of literature retrieval purposes. This Index, based on Volumes 25-34, Russian authors according to the following transliteration contains not only a simple compilation of index information but scheme."

Feasibility of Distinguishing Supervisors' Policies in Evaluation of Subordinates by Using Ratings of Simulated Job Incumbents

Sep 02 2020 Supervisors in 4 specialties differed in the importance they attached to selected qualifications in subordinates, when these subordinates were known to them only by patterns of trait scores. The technical problems considered in the statistical analyses involve some recent developments in the application of regression techniques. Groups of 50 supervisors in AFSCs 43171, 43190, 64670, and 64770 rated

a set of 250 profiles of trait scores representing subordinates in AFSCs 43151, 43171, 64650, and 64750. Each supervisor assigned 250 worth-to-the-Air Force ratings, using a 9-point scale and fixed allotments of each value. These ratings served as criteria, with the trait scores as predictors, providing a regression equation for each rater (his policy). Using the Judgment Analysis (JAN) technique, the policies were grouped, and the loss in prediction computed when moving from 50 different equations (policies) to a single equation for a given specialty. Average predictions were high, and the grouping loss small. Comparing JAN to factor analysis techniques, it was concluded that the JAN method was efficient, but that a factor strategy method aided in qualitative interpretation of rater policies. Demographic and personal data collected on the raters showed no meaningful relationship to their policies.
